Streamline Cannabinoid Analyses with Our New Neutrals Mix

Our new nine-component cannabinoid mix streamlines cannabinoid analyses. By combining nine compounds into one ampul, calibration complexity has been simplified, enabling labs to minimize errors, save time, and reduce cost. A high concentration of 1000 µg/mL adds additional flexibility in constructing calibration curves and lowers solvent spiking volume for labs assessing potency recoveries.

Our cannabinoid neutrals mix is a certified reference material (CRM), manufactured and QC-tested in Restek's ISO-accredited labs. Verified composition and stability, with two independently produced lots available, help satisfy your ISO requirements.

CBGA is a precursor acidic cannabinoid for THCA, CBDA, and CBCA via enzymatic reactions. In the presences of heat, CBGA decarboxylates to form CBG. LC analysis of CBGA is highly recommended since this cannabinoid is considered temperature sensitive. Adding CBGA to the list of compounds measured in potency testing allows for a more comprehensive characterization of the cannabinoid content in a given cannabis product. Combine with Restek's other cannabinoid standards to create a multicomponent instrument calibration set per your specific requirements.

* Note: When combining a large number of compounds with different chemical functionalities, mix stability can be an issue. In formulating these standards, we extensively studied the 204 compounds involved, then grouped them into as few mixes as possible while still ensuring maximum long-term stability and reliability. For quantitative analysis, we recommend analyzing each mix separately to ensure accurate results for every compound.

** Note: In this standard, fluzinam should only be used for qualitative analysis. A single-component standard (cat.# 31982) is available for quantitative analysis.

GC Multiresidue Pesticide Kit

- Accurately identify and quantify pesticide residues by GC-MS/MS in fruits, vegetables, botanicals, and herbals such as tea, ginseng, ginger, echinacea, and dietary supplements.
- Comprehensive 203-compound kit covers food safety lists by the FDA, USDA, and other global governmental agencies; individual ampuls also sold separately.

QuEChERS Performance Standards Kit

- Designed for use in all QuEChERS methods for pesticides in fruits and vegetables, including the original unbuffered method, AOAC 2007.01, and EN 15662.
- Kit contains organochlorine, organonitrogen, organophosphorus, and carbamate pesticides commonly used on fruits and vegetables.
- Volatile, polar, active, base-sensitive, and nonvolatile compounds are included to allow comprehensive evaluation of QuEChERS extraction and cleanup efficiencies, and optimization of GC and LC instrumental conditions.
- Ideal for initial method evaluations and ongoing method performance validations.
- Analytes are divided into three ampuls based on compatibility for maximum stability and shelf life.*
- Precise formulations improve data quality and operational efficiency; spend more time running samples and less time sourcing and preparing standards.
- Quantitatively analyzed to confirm the composition and stability of each mixture.

*When combining compounds with different functionalities, chemical stability can be an issue. The analytes in this kit are separated into three mixes to ensure maximum long-term storage stability. For analysis, a fresh working standard should be prepared by combining the three kit mixes in a 1:1:1 ratio to prepare a 100 µg/mL working standard solution. Once blended, Restek does not recommend storing working standards or subsequent dilutions for future use.

Contains 1 mL each of these mixtures; 31153: QuEChERS Performance Standard A 31154: QuEChERS Performance Standard B 31155: QuEChERS Performance Standard C.
